

**BIOGRAPHICAL SKETCH**

Provide the following information for the Senior/key personnel and other significant contributors.  
Follow this format for each person. **DO NOT EXCEED FIVE PAGES.**

NAME: Ming-Ying Leung

eRA COMMONS USER NAME (credential, e.g., agency login): mleung

POSITION TITLE: Professor of Mathematical Sciences

EDUCATION/TRAINING (*Begin with baccalaureate or other initial professional education, such as nursing, include postdoctoral training and residency training if applicable. Add/delete rows as necessary.*)

INSTITUTION AND LOCATION	DEGREE (if applicable)	Completion Date MM/YYYY	FIELD OF STUDY
University of Hong Kong	B.Sc.	1980	Mathematics
University of Hong Kong	M.Phil.	1983	Mathematics
Stanford University	M.S.	1988	Computer Science
Stanford University	Ph.D.	1989	Mathematics

**A. Personal Statement**

My research focuses on developing statistical models and computational algorithms for bioinformatics analysis of biomolecular sequence data. In particular, I have developed Markov models, scan statistics, and computational algorithms to identify unusual palindromic patterns in the nucleotide sequences and have applied them to the analysis of genomic sequences of DNA and RNA viruses like the herpesviruses and SARS coronaviruses. I have also been developing efficient computational approaches for predicting secondary structures, including pseudoknots, of long RNA sequences. We have devised methods to circumvent the extremely high demands of memory and computing time in the structure prediction problem by using grid computing technologies available in the UTEP Border Biomedical Research Center (BBRC) Bioinformatics Computing Core Facility, where I serve as director. The research in these projects has resulted in several bioinformatics software packages publicly accessible online ([bioinformatics.utep.edu/BCL](http://bioinformatics.utep.edu/BCL)). For more specific implementation of bioinformatics computing tools for RNA research, we have launched the RNA virtual laboratory ([rnavlab.utep.edu](http://rnavlab.utep.edu)) for RNA sequence analysis, structure prediction, and database development. Using a whole-exome sequencing approach coupled with gene ontology analysis to identify exonic DNA variants in patients with ALL (Acute Lymphoblastic Leukemia) from the El Paso Children's Hospital, we have added a Python-based pipeline called OncoMiner ([oncominer.utep.edu](http://oncominer.utep.edu)) to our repertoire of tools for genomic data analytics. These web-based software applications have been made available to the biomedical research community worldwide. I have served as PI and co-PI in various projects for setting up and managing computational facilities for biomedical research and as director of the Bioinformatics and Computational Science Programs for administering graduate research training at UTEP. Over the past 20 years, my research has been funded by NIH, NSF, IBM, and the Texas NHARP in viral genome replication, sequence analysis, and RNA structural prediction with a long record of publication in these areas. In addition, I am involved in several collaborative research projects in identifying protein biomarkers for hepatocellular carcinoma and studying the effects of different blood flow patterns on gene expression. In this proposed project, I will manage the bioinformatics research support component of the Bioinformatics and Biostatistics Unit in the Research Infrastructure Core, implementing and maintaining necessary bioinformatics computing tools, including designing, implementation, and analysis of all genomic experiments with any new software that may be needed. I will perform bioinformatics and statistical analyses of the data from the genomic and proteomic experiments and to design and implement any new software that is required for the proposed research.

## **B. Positions and Honors**

### **Positions and Employment**

- 1980-1983: Teaching Assistant, Department of Mathematics, University of Hong Kong  
 1982-1983: Lecturer, Department of Extramural Studies, University of Hong Kong  
 1983-1989: Research Assistant and Teaching Fellow, Department of Mathematics, Stanford University  
 1989-2003: Assistant and Associate Professor, Division of Mathematics and Statistics, The University of Texas at San Antonio  
 1993 : Visiting Research Fellow, Department of Statistics, University of California at Berkeley and Department of Pharmaceutical Chemistry, University of California at San Francisco  
 2001-2002: Visiting Associate Professor, Department of Statistics, Rice University  
 2003- : Professor, Department of Mathematical Sciences, and Director, Bioinformatics Program, The University of Texas at El Paso  
 2013- : Director, Computational Science Program, The University of Texas at El Paso

### **Other Experience and Professional Memberships**

- 1990-1991: Consultant for the mathematical molecular biology groups at the University of Southern California and Stanford University  
 2002-2003: Editorial Board Member, *Advances and Applications in Statistics*  
 2002-2004: Co-chair, Organizing Committee for the International Workshop on Statistical Methods in Microarray Data Analysis, Institute of Mathematical Sciences, National University of Singapore  
 2005 : Chair, Joint Session in Bioinformatics, 2005 INFORMS Annual Meeting  
 2005-2009: External Advisory Board Member, NSF and HHMI funded "Talent Expansion in Quantitative Biology" project at East Tennessee State University  
 2007-2013: Associate Editor, *INFORMS Journal on Computing*  
 2008 : Chair, Invited paper session in Stochastic Models for Biological Processes, International Workshop on Applied Probability, July 2008, Compiègne, France  
 2008-2010: Member, The University of Texas System Computational Biology Workgroup for the Cancer Prevention and Research Institute of Texas  
 2009- : Member, NIH-RCMI Translational Research Network Translational Informatics Subcommittee  
 2010 : External Review Panelist for West Virginia IDeA Network for Biomedical Research Excellence, Research Competitiveness Program, American Association for the Advancement of Science  
 2010 : Chair, Session on Stochastic Models for Biological Systems, 2010 INFORMS Annual Meeting  
 2011 : Chair for invited Session Computational Methods in Biomolecular and Phylogenetic Analyses, International Federation of Operational Research Societies (IFORS) Conference, July 2011, Melbourne, Australia.  
 2011 : Chair for invited Cluster on Computational Biology, Institute for Operations Research and Management Science (INFORMS) Annual Conference, November 2011, Charlotte.  
 2012- : Organizer, Joint UTEP/NMSU Workshop on Mathematics, Computer Science, and Computational Sciences  
 2013- : Mentor, National Alliance for Doctoral Studies in the Mathematical Sciences  
 2016 : Member, Scientific Program Committee, International Workshop on Applied Probability, Toronto

### **Honors**

- 1986-1987: Andrew Mellon Foundation Research Award, Institute of Population and Resource Studies, Stanford University  
 2004 : Professor Y.C. Wong Visiting Lectureship, University of Hong Kong

- 2007-2008: Outstanding Performance Award, Office of Research and Sponsored Programs, UTEP  
2014-2015: Outstanding Performance Award in Securing Extramural Funding, Office of Research and Sponsored Projects, UTEP  
2017 : Student Choice Award for Outstanding Teaching, Department of Mathematical Sciences, UTEP

### C. Contribution to Science

1. Virtual Labs Established for Finding Inversions in Nucleic Acid Sequences and Their Functions: With my early training and interests in designing efficient algorithms for identifying matches in multiple long molecular sequences, my research focus has been on DNA sequences of Herpesvirus genomes. The most significant contribution is the mathematical characterization of nonrandom clusters of palindromes (e.g., GCAATATTGC), which is a short DNA segment whose reverse complementary sequence is identical to itself. The probability of finding origins of replication around nonrandom clusters of palindromes has been shown to be higher. A software package called MOLPAC was developed for locating these replication origins, which are potential targets for developing vaccines against the growth and spread of viruses. Palindromes are special cases of the more general patterns of inversions in RNA sequences. Each inversion is a palindrome with a gap between the two complimentary stem sequences. With recent outbreaks of RNA viruses (e.g., Coronaviruses, West Niles), our attention has shifted to viruses with RNA molecules as their genomes. Inversions in these RNA molecules have been found to be involved in the formation of stem loops and pseudoknots, sequence patterns important for the formation of their secondary structures and functioning of the viral genomic sequences. Therefore, the Ribonucleic Acid Virtual Laboratory (RNAVLab) has been established for providing a series of software applications and online databases for analyses of RNA secondary structures. My group continues to find new approaches, such as AT excursion and least-squares support vector machine, to predict the locations of these replication origins more accurately, facilitating the efforts to find targets of vaccine development with less experimentation.

2. Databases for RNA Pseudoknots and G Protein-Coupled Receptors (GPCR): As an extension to our RNAVLab, we have included a standalone database for analyses of RNA secondary structures called PseudoBase++ ([pseudobaseplusplus.utep.edu](http://pseudobaseplusplus.utep.edu)) with faster algorithms implemented as an updated version of the original PseudoBase. It is a searchable database of RNA sequences containing stem loops or pseudoknots, wrapped by a versatile, user-friendly interface providing scientists with a powerful engine to access, search, select, and sort data based on different fine-grained criteria. The PseudoBase++ interface allows scientists to visualize selected structures with PseudoViewer, to map existing sequences to GenBank, and to insert new pseudoknots to the PseudoBase dataset through a syntax-controlled interface that prevents structural error for long sequences. We have also developed a pipeline called GPCR Prediction Ensemble (GPCR-Pen), available at [gpcr.utep.edu](http://gpcr.utep.edu) with an online database containing more than 3000 confirmed GPCR (CG) and 3500 non-GPCR (CN) from more than 1200 different organisms including bacteria and viruses. It also incorporates predicted GPCRs (PG) from three organisms. Each protein, with a unique identification number, is linked to its source organism, gene name, protein name, sequence length, and other features such as amino acid and dipeptide compositions.

3. RNA Structure and Next-Generation Sequencing Data Analytics Using High-Performance Computing (HPC): A series of JAVA-based applications and their upgrades have been released in the last few years, e.g., InversFinder 2.0, Segmenta 2.0, and the complete bundle of RNASSA 2.0 for RNA secondary structure analysis has been made available online with the latest version with updates since 2015. The core of this software is a new RNA segmentation algorithm based on optimal cuts between inversion clusters along the RNA sequence, relying on the mathematical theory of excursion. With the use of high-throughput grid computing across a network of computers (Bioinformatics Grid) managed by the HTCondor software for task scheduling, we have been able to reduce the computing time from days to a few minutes for structure prediction of RNA over 3000 bases. To preprocess very large datasets efficiently for our OncoMiner pipeline ([oncominer.utep.edu](http://oncominer.utep.edu)) implemented to help biomedical researchers analyze genomic sequence variants in patients with cancer, the preprocessing program for parsing data files has been parallelized on local HPC systems and the Blue Waters system at the National Center for Supercomputing Applications.

4. Extension of the Sequence Segmentation Algorithm for Other Computationally Intensive Problems. With the Translational Bioinformatics Lab and Structural Bioinformatics Lab housing the Bioinformatics Grid with videoconferencing capability established in 2012, we have initiated collaborative projects requiring computationally-intensive tasks and data transfer between remote sites. In collaboration with Dr. Gerken at Case Western Reserve University on a project entitled "Initiation and Regulation of Mucin Type O-Glycosylation" with specific aims to understand the processes governing O-glycan site selection and O-glycan elongation in order to address the molecular mechanisms and biology of O-glycosylation. We have already constructed a working prototype of a web-based software tool ISOGLYP (Isoform Specific O-Glycosylation Prediction), for predicting O-glycosylation sites in amino acid sequences, available at [isoglyp.utep.edu](http://isoglyp.utep.edu). Using a more sophisticated conceptual model on the Bioinformatics Grid with the high-throughput HTCondor system, our ongoing effort is to extend the current version by incorporating recent data on the N- or C-terminal targeting of previously glycosylated peptide substrate. Other projects include the application of super-resolution techniques in improving mammograms and the implementation of a pipeline for predicting GPCRs (G-protein coupled receptors) using hidden Markov models, and the development of bioinformatics tools for ecoinformatics studies.

08/02/2019 – 02/29/2024

Source: NIMHD RCMI Program

Title: Border Biomedical Research Center (BBRC)

Major Goal: The BBRC Research Infrastructure Core (RIC) facility will provide principal investigators, staff, and students access to state-of-the-art equipment to achieve the goals of their proposed research projects. Resources within RIC will provide critical support to new and early career faculty investigators to enhance their research. Since the inception of the BBRC, research productivity in terms of publications and grants by faculty has steadily increased and we envision this will continue for years to come. The BBRC is well-poised to usher in a new period of research prosperity and productivity for biomedical, clinical and behavioral research and community engagement at this institution and other institution in the border region.

Role: Co-Director, Research Infrastructure Core

**Completed Research Support**

Grant: 1U01GM113534 Gerken (PI)

12/01/2014 – 11/30/2019

Source: NIH/Case Western Reserve University

Title: Initiation and Regulation of Mucin Type O-Glycosylation

Major Goal: To study the specificity of the large family (20 members in humans) of polypeptide-GalNAc transferases (ppGalNAcTs) that initiate mucin-type O-glycosylation. The results of this work will provide specific information on the activities and biological roles of the enzymes that perform mucin-type glycosylation and will allow the eventual development of specific therapeutics for the treatment of a range of hormonal, metabolic, inflammatory, cardiovascular and neoplastic diseases.

Role: Subcontract PI

Grant: 5G12MD007592 Kirken (PI)

07/01/2014 – 03/31/2019

Source: NIH

Title: Border Biomedical Research Center

Major Goal: Achieving the RCMI-BBRC goal and objectives will help create a healthier Paso de Norte border region by spearheading, sustaining and leveraging biomedical research and practice, and increasing the work force to develop countermeasures to health problems concentrated in the area but of national consequence, and provide a highly competitive faculty and training setting at UTEP to prepare minority students for entry into the biomedical research mainstream of the nation.

Role: Director, Bioinformatics Core Facility
