

11.3 The Product and Quotient Rules

Product Rule If $f(x)$ and $g(x)$ are differentiable functions of x , then so is their product $f(x)g(x)$, and

$\frac{d}{dx}[f(x)g(x)] = f'(x)g(x) + f(x)g'(x)$. In words, the derivative of the product is the derivative of the first times the second, plus the first times the derivative of the second.

Examples: Find the derivative.

$$1. \quad y = 3x^2(2x+1) \quad \begin{array}{l} f(x) = 3x^2 \\ f'(x) = 6x \end{array} \quad \begin{array}{l} g(x) = 2x+1 \\ g'(x) = 2 \end{array}$$

$$y' = 6x(2x+1) + 3x^2(2)$$

$$y' = 12x^2 + 6x + 6x^2 \quad \text{or} \quad y' = 18x^2 + 6x$$

$$2. \quad y = (x^{0.7} - 4x - 5)(x^{-1} + x^{-2})$$

$$\begin{array}{l} f(x) = x^{0.7} - 4x - 5 \\ f'(x) = 0.7x^{-0.3} - 4 \end{array} \quad \begin{array}{l} g(x) = x^{-1} + x^{-2} \\ g'(x) = -x^{-2} - 2x^{-3} \end{array}$$

↓ Parentheses are important

$$y' = (0.7x^{-0.3} - 4)(x^{-1} + x^{-2}) + (x^{0.7} - 4x - 5)(-x^{-2} - 2x^{-3})$$

no way am I simplifying this one!!

$$3. \quad f(x) = \sqrt{x}(x^5 + 3x^2 - x^{-3})$$

$$\begin{array}{l} f(x) = \sqrt{x} = x^{1/2} \\ f'(x) = \frac{1}{2}x^{-1/2} \end{array} \quad \begin{array}{l} g(x) = x^5 + 3x^2 - x^{-3} \\ g'(x) = 5x^4 + 6x + 3x^{-4} \end{array} \quad f'(x) = \frac{1}{2}x^{-1/2}(x^5 + 3x^2 - x^{-3}) + \sqrt{x}(5x^4 + 6x + 3x^{-4})$$

$$4. \quad f(x) = (x^2 - 3x + |x|)\left(\frac{1}{x^3} - \frac{7}{x^2} + 3\right)$$

$$\begin{array}{l} f(x) = x^2 - 3x + |x| \\ f'(x) = 2x - 3 + \frac{|x|}{x} \end{array} \quad \begin{array}{l} g(x) = \frac{1}{x^3} - \frac{7}{x^2} + 3 = x^{-3} - 7x^{-2} + 3 \\ g'(x) = -3x^{-4} + 14x^{-3} \end{array}$$

$$f'(x) = (2x - 3 + \frac{|x|}{x})(x^{-3} - \frac{7}{x^2} + 3) + (x^2 - 3x + |x|)(-3x^{-4} + 14x^{-3})$$

Quotient Rule If $f(x)$ and $g(x)$ are differentiable functions of x , then so is their quotient $f(x)/g(x)$

(provided $g(x) \neq 0$), and $\frac{d}{dx} \left(\frac{f(x)}{g(x)} \right) = \frac{g(x)f'(x) - f(x)g'(x)}{[g(x)]^2}$. In words, the derivative of the

quotient is the bottom derivative of the top, minus the top times the derivative of the bottom, all over the bottom squared. Or, lodehi - hidelo over lo squared.

Examples: Find the derivative.

$$1. y = \frac{3x-9}{2x+4}$$

$$\begin{aligned} \text{lo} &= 2x+4 & \text{hi} &= 3x-9 \\ \text{delo} &= 2 & \text{delhi} &= 3 \end{aligned}$$

$$y' = \frac{(2x+4)(3) - (3x-9)(2)}{(2x+4)^2}$$

Note: the extensive use of parentheses are important!

$$2. y = \frac{3x^2-9x+11}{4x-1}$$

$$\begin{aligned} \text{lo} &= 4x-1 & \text{hi} &= 3x^2-9x+11 \\ \text{delo} &= 4 & \text{delhi} &= 6x-9 \end{aligned}$$

$$y' = \frac{(4x-1)(6x-9) - (3x^2-9x+11)(4)}{(4x-1)^2}$$

Another note: the $(4x-1)$ from the first part does not cancel with the denominator because it is not found after the subtraction

$$3. f(x) = \frac{\sqrt{x}+7}{2x^3-14x^2+x}$$

$$\begin{aligned} \text{lo} &= 2x^3-14x^2+x & \text{hi} &= \sqrt{x}+7 \\ \text{delo} &= 6x^2-28x+1 & \text{delhi} &= \frac{1}{2}x^{-1/2} \end{aligned}$$

$$f'(x) = \frac{(2x^3-14x^2+x)(\frac{1}{2}x^{-1/2}) - (\sqrt{x}+7)(6x^2-28x+1)}{(2x^3-14x^2+x)^2}$$

$$4. f(x) = \frac{x^{-6}+7x^3-1}{|x|}$$

$$\begin{aligned} \text{lo} &= |x| & \text{hi} &= x^{-6}+7x^3-1 \\ \text{delo} &= \frac{|x|}{x} & \text{delhi} &= -6x^{-7}+21x^2 \end{aligned}$$

$$f'(x) = \frac{|x|(-6x^{-7}+21x^2) - (x^{-6}+7x^3-1)\left(\frac{|x|}{x}\right)}{(|x|)^2}$$
